

KANE-O'S HASHME v1.2

# TECHNICAL SPECIFICATION

WINDOWS 11+ x64 / SHA-256 / LOCAL-FIRST

## PRIVATE SOURCE-AVAILABLE CANDIDATE

Technical, integration and release reference for website development

OWNER / PUBLISHER: KANE-O, TRADING AS KANE-O-TECH

SOVEREIGN AUTHORITY: SOVEREIGN / KANE-O

SUPPORT AND SECURITY: hashme256@proton.me

BUILD RECORD: 19 SEPTEMBER 2026

# 1. Product and Platform

Authoritative build, runtime and data-boundary specification

|                    |                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------|
| PRODUCT            | HASHME - KANE-O's lightweight SHA-256 utility                                                         |
| RELEASE            | v1.2.0; assembly/file version 1.2.0.0                                                                 |
| OWNER / PUBLISHER  | KANE-O, trading as KANE-O-TECH                                                                        |
| AUTHORITY          | Sovereign / KANE-O                                                                                    |
| PLATFORM           | Windows 11 or later; x64; Per-Monitor V2 high-DPI aware                                               |
| APPLICATION        | WPF, net10.0-windows; self-contained single-file PE32+ GUI                                            |
| INTERFACE          | 600 x 54 device-independent pixels; floating strip; whole-window drag/drop; notification-area support |
| HASHING            | SHA-256; 64 lowercase hexadecimal characters; streaming, local and read-only                          |
| INSTALL SCOPE      | Per-user, no elevation; %LOCALAPPDATA%\KANE-O\HASHME; Start-menu shortcut                             |
| LOCAL DATA         | settings.json and hash-records.json under %LOCALAPPDATA%\KANE-O\HASHME                                |
| STARTUP            | Optional HKCU Run entry: KANE-O.HASHME                                                                |
| NETWORK            | No network access requested or used                                                                   |
| SOURCE FILE SAFETY | Dropped files are read for hashing and are never rewritten                                            |
| SUPPORT / SECURITY | hashme256@proton.me                                                                                   |

## Processing boundary

INPUT FILES -> STREAMING SHA-256 -> LOCAL EVIDENCE -> STATUS + COPY

No cloud service, upload path, telemetry channel or remote account is required.

## 2. Functional and Evidence Model

Operational states, verification inputs and deterministic output

| STATUS    | SIGNAL | AUTHORITATIVE MEANING                                                               |
|-----------|--------|-------------------------------------------------------------------------------------|
| READY     | IDLE   | Waiting for one or more files.                                                      |
| NEW       | BLUE   | No matching local record or recognised SHA-256 sidecar was found.                   |
| EXISTING  | ORANGE | The recalculated hash matches a prior path, identical content or recognised record. |
| CHANGED   | RED    | The path was recorded before, but the current bytes produce a different hash.       |
| MISMATCH  | RED    | The current hash does not match a recognised sidecar or SHA256SUMS manifest.        |
| MATCH     | GREEN  | Pair Match received two files with identical SHA-256 values.                        |
| DIFFERENT | RED    | Pair Match received two files with different SHA-256 values.                        |
| ERROR     | RED    | The file could not be read or hashed; the displayed detail explains why.            |

### Evidence inputs and controls

- Sidecars: filename.ext.sha256 or filename.sha256; a bare 64-character hash is accepted.
- Manifests: SHA256SUMS, SHA256SUMS.txt or SHA256SUMS.sha256 in the file directory.
- Accepted lines include conventional 'hash filename' and BSD 'SHA256 (filename) = hash' formats.
- Pair Match is armed for one drop of exactly two files, then disarms automatically.
- Changed records are fail-closed and require explicit approval before baseline replacement.
- Copy returns complete filenames and full hashes even when the visible field is truncated.

#### CLEAR IS NOT DELETE

Clear resets the visible result and Pair Match state; it does not erase settings or the local catalogue.

## 3. Build, Packaging and Integrity

Reproducible toolchain, test evidence and current private-release boundary

|                 |                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| BUILD TOOLCHAIN | Official .NET SDK 10.0.401; WiX Toolset 5+                                                                                                  |
| BUILD RESULT    | PASS - 0 warnings, 0 errors                                                                                                                 |
| CORE TESTS      | PASS - 15/15                                                                                                                                |
| PUBLISH MODE    | Windows x64, self-contained, compressed single-file executable                                                                              |
| PORTABLE        | ZIP containing HASHME.exe, README, release notes, HASHME licence and notices, brand-asset terms, and .NET notices                           |
| INSTALLER       | Per-user MSI; no elevation; same-version upgrades permitted                                                                                 |
| AUTHENTICODE    | Current candidate is unsigned                                                                                                               |
| PUBLICATION     | Not authorised; company formation, signed IP assignment, contributor terms, commit privacy, signing policy and go-live approval remain open |

### SHA-256 release evidence

|                          |                                                                  |
|--------------------------|------------------------------------------------------------------|
| HASHME.exe               | cbb93e7f514bcbe7f8ae6e0c28cd4386544c9f15a4aee7e1ced9d93dbd2c2958 |

| Windows x64 MSI          | 6e69459eee201fe997c91475fb4de9312ba5919a2afe95617330b04989c5193b |
| Original mascot PNG      | e115eee7ef8df70ac89337664dbe4a8efa4451527a1888565264b1773a4e3319 |

### Website integration notes

- Use the supplied approved cover and original mascot files without redrawing the character.
- Product name: HASHME. Owner/publisher label: KANE-O, trading as KANE-O-TECH.
- Public contact: hashme256@proton.me.
- Describe this candidate as source-available, not OSI-approved open-source software.
- Do not describe this private candidate as publicly released or authorised for publication.
- SHA-256 is a fingerprint and evidence mechanism; it is not encryption.

This specification records the current private candidate. It does not authorise publication.
